

System testing:

- When texting to AI-Chat for 3 or 4 times or uploading pdf files for 2 or 3 times consecutively, the AI chat panel sends these results.

⚠ AI error: You have exceeded the Gemini API quota or rate limit. If you just uploaded a large PDF, it may have exceeded the allowed token count for your current AI Studio billing plan. Please check your Google AI Studio plan and budget caps or try using a smaller document (Max 5MB).

Resolved: On browser refresh, AI error resolved.

- Max upload image file 5 MB.

UC2_TC8

- AI-Chat panel displays, text message, "I've updated the weight for Part 1 to 5 kg." but when switching at manual mode, the Part 1 weight is still containing its previous weight i.e. 2.85 kg. The previous image is being sent to AI again.

- The AI chat shows that AI updated Part 1 weight but when switching at the manual mode it still contains the same previous Part 1 weight. On every text message to AI-Chat, the previously sent image is also sent again.

- The user or Integrator can upload any images file that is not relevant to the project although images type is either JPG, PNG, STEP, STL, etc. and size are relevant i.e. less than 5 MB. This will automatically give the entire responsibility to Scape Engineer for checking Project Card details.

- UC6_TC03 -> Pending

- UC6_TC06 -> When unlock request has been sent by user, The Evaluator can directly click Unlock User (Allow User Changes) button without clicking on either 'Approve & Unlock' or 'reject' button.

- (IMP) When Evaluator directly clicks at 'Unlock Project (Allow User Changes)' button at the time when request was also sent by the user, the Project gets unlocked, the user could then change it to draft state and edit project details but the unlock request still appears or exist on the Project Card on both users (Evaluator and Integrator) and that old unlock request permission with text message still appears on the Evaluator UI.

- When filling in questionnaire fields like total of different parts in project, Bin outer Dimensions (mm) etc., "Modified (Re-Evaluate)" icon appears on each questionnaire field.

- Unable to generate AI Advice for Extreme text length with all filled fields questionnaire project details Project Card.

Acceptance testing:

- The AI chat does not update or edit existing draft project card details when new details are given by either text, voice or pdf file although the AI chat response with approval message (AI-Auto filling only works one time for the newly created project card) -> context is re-iterated and newly changed values in manual mode is overwritten again -> Use case 2.
- Some time when filling project details consecutively whether (text or voice), the already filled image again appears for approval although the user did not send any command to assign that already uploaded image.
- Technical datasheet: Project details like images cannot be inserted or uploaded in the visual evidence tab from the technical datasheet.
- Sometimes when user as Integrator try to switch to evaluator mode or evaluator tries to switch to user mode, the user will view the previous evaluator mode UI or the Integrator mode UI. -> The system lacks the real-time UI update on switching user roles. -> User should click to save changes button on switching user role.
- The exported pdf or md files from generated AI advice drawer or verdict results in poor or wrong format outputs. Issues in the generated pdf files such as overlapping of questionnaires field and answers, field observations summary text or content does not fit on the summary text box, page number displaying total page number in every page, some questionnaire Field and answers displaying in incorrect places etc.
